

EVOLUTION OF VISION

VIS products are intelligent and innovative viewing modules which superimpose information such as text, images or graphics in the viewing field of the observer.

The information is superimposed in the VIS products using purely optical/mechanical methods, thus guaranteeing long service life. Because the use of electricity is avoided, VIS products are universally applicable, be it high in the mountains or in urban surroundings.

Any type of desired information can be superimposed as text, graphics, photos or line drawings. Potential information that can be superimposed includes geographical designations, cultural descriptions or historical data.

VIS products - the intelligent viewing modules - with more than 180 satisfied customers all over Europe!
